

Ad Campaign Performance Report: Insights and Metrics

Source: KAG_conversion_data.csv, limited to the 936 ads with at least one click (the same scope as your MA.xlsx). All figures were recomputed from the raw data and tie exactly to the MA.xlsx totals. The companion workbook Ad_Performance_Metrics.xlsx holds every number below as live formulas.

1. Executive summary

The 936 ads spent **\$58,705** and generated **3,052 total conversions** and **1,003 approved conversions**, an overall cost per approved conversion (CPA) of **\$58.53**. Performance is highly uneven. Three findings drive most of the opportunity:

1. **Men aged 30-34 are the most efficient audience; women aged 45-49 the least.** Their CPAs are \$29.05 and \$124.38, a 4.3x gap. The 45-49 group takes 35% of spend and returns 20% of approved conversions.
2. **Women click more cheaply but convert worse.** Women have the higher click-through rate (0.021% vs 0.015%) and lower CPC (\$1.45 vs \$1.69), but men convert 10.5% of clicks versus 6.5% and cost 39% less per approved conversion.
3. **Budget is concentrated in the weakest-converting campaign.** Campaign 1178 receives 94.8% of spend at a \$64.05 CPA, while campaigns 916 and 936 cost \$9.36 and \$24.52, though on very small budgets.

Men, especially men aged 30-34, are under-invested in all three campaigns. Men get a smaller share of spend than of approved conversions in each campaign, and men 30-34 take 13% of campaign 1178's spend but 28% of its approved conversions. Their over-representation in campaign 916 explains only about 6.5% of that campaign's cost advantage over 1178 (section 3.5).

Estimated upside: the main recommendations together could cut overall CPA by roughly 15% to 20% (from \$58.53 to about \$47 to \$50), which equals 179 to 250 more approved conversions on the same budget. Each recommendation's estimate and its assumptions are in section 4.1.

About 25% of spend (\$14,754) went to 423 ads that produced no approved conversion.

2. Overall KPIs

Metric	Value
Impressions	212,945,947
Clicks	38,165
Spend	\$58,705.23
Total conversions	3,052
Approved conversions	1,003
CTR (clicks / impressions)	0.018%
CPM	\$0.276
CPC	\$1.54
Conversion rate, CR (total conv. / clicks)	8.0%
Approved conversion rate, ACR (approved / clicks)	2.6%
Approval rate, AR (approved / total conv.)	32.9%
Cost per total conversion	\$19.24
Cost per approved conversion (CPA)	\$58.53

Only one in three conversions is approved, so the biggest lever after targeting is the approval step itself.

3. Findings

3.1 Age: efficiency falls steadily as age rises

Age	Spend share	Approved share	CTR	CR	CPA
30-34	26.0%	44.2%	0.014%	13.8%	\$34.43
35-39	18.9%	19.8%	0.017%	8.3%	\$55.84
40-44	19.7%	16.2%	0.020%	6.5%	\$71.54
45-49	35.3%	19.8%	0.022%	4.7%	\$104.27

Older users click more but convert far less, so their clicks are low-intent. The 45-49 group is the largest budget line and the most expensive per result. Younger users click less but convert about three times as often.

3.2 Gender: men convert, women click

Gender	Ads	Spend share	Approved share	CTR	CPC	CR	AR	CPA
Men	473	41.2%	53.4%	0.015%	\$1.69	10.5%	35.9%	\$45.15
Women	463	58.8%	46.6%	0.021%	\$1.45	6.5%	30.0%	\$73.88

Women receive 59% of budget but deliver 47% of approved conversions. Men also have a higher approval rate, so the gap exists both before and after the approval step. A chi-square test on approved conversions per click confirms the gender difference is statistically significant ($p < 0.001$), as is the difference between ages 30-34 and 45-49 ($p < 0.001$).

3.3 Age and gender combined

Segment	Spend share	Approved share	CPA	Efficiency index
Men 30-34	13.0%	26.2%	\$29.05	2.02
Women 30-34	13.0%	17.9%	\$42.29	1.38
Men 35-39	8.6%	10.9%	\$46.34	1.26
Men 40-44	7.1%	7.3%	\$57.44	1.02
Women 35-39	10.3%	9.0%	\$67.35	0.87
Men 45-49	12.5%	9.1%	\$80.41	0.73
Women 40-44	12.6%	8.9%	\$83.11	0.70
Women 45-49	22.9%	10.8%	\$124.38	0.47

Efficiency index = approved share / spend share. Above 1.0 means the segment returns more than its share of budget.

Women 45-49 absorb nearly a quarter of the budget (\$13,433) at under half the average efficiency. Men 30-34 produce 26% of approved conversions from 13% of spend.

3.4 Campaigns

Campaign	Ads	Spend	Spend share	Approved	CR	CPA	Efficiency index
916	35	\$150	0.3%	16	34.5%	\$9.36	6.26
936	288	\$2,893	4.9%	118	17.9%	\$24.52	2.39
1178	613	\$55,662	94.8%	869	7.4%	\$64.05	0.91

Campaigns 916 and 936 look far more efficient, but treat this with caution. Their budgets are tiny, and 1178 targets all 40 interest categories while 916 and 936 target 14 and 24. Section 3.5 tests whether audience mix explains the gap; it explains very little. A controlled budget test is the right way to find the real cause.

3.5 Do gender and age mix explain the campaign gap?

No. Men, and men aged 30-34 in particular, are the best-performing and most under-invested audience in every campaign, but each campaign's cost advantage holds inside every audience group, so audience mix explains very little of it.

Men are under-invested in every campaign. Campaign 1178 has the lowest ACR and AR (2.4% and 32.7%), 916 the highest (14.2% and 41.0%), and 936 sits between them (6.0% and 33.1%).

Campaign	Gender	Share of ads	Share of spend	Share of approved	ACR	AR	CPA	Efficiency index
916	Men	63%	53%	63%	16.4%	40.0%	\$7.99	1.17
916	Women	37%	47%	38%	11.5%	42.9%	\$11.64	0.80
936	Men	38%	18%	41%	13.7%	36.6%	\$10.69	2.29
936	Women	62%	82%	59%	4.3%	31.1%	\$34.01	0.72
1178	Men	56%	42%	55%	3.5%	35.7%	\$49.39	1.30
1178	Women	44%	58%	45%	1.8%	29.7%	\$81.98	0.78

In every campaign men get a smaller share of spend than of approved conversions, and cost 0.69x, 0.31x and 0.60x as much per approved conversion as women in 916, 936 and 1178. The gap is strongest in 936, where men get 18% of spend and 41% of approved conversions. It is weakest in 916, where men's edge comes only from converting more clicks and women are approved slightly more often (42.9% vs 40.0%). That rests on only 13 women's ads and 6 approved conversions.

The campaign matters more than gender: women in 916 (\$11.64) and in 936 (\$34.01) cost less per approved conversion than men in 1178 (\$49.39).

Men aged 30-34 are over-represented in 916, but that explains little.

Campaign	Share of ads	Share of spend	Share of approved	CPA, men 30-34	CPA, everyone else
916	28.6%	18.3%	25.0%	\$6.84	\$10.20
936	14.2%	4.8%	16.1%	\$7.24	\$27.84
1178	17.5%	13.4%	27.6%	\$31.15	\$76.61

Men 30-34 are the cheapest segment in all three campaigns, and in 1178 they take 13% of spend but 28% of approved conversions. The mix test holds their cost and the cost of everyone else fixed in 1178 and changes only the spend split. At 916's mix (18.3% on men 30-34), 1178's CPA would fall from \$64.05 to \$60.49, which covers \$3.57 of the \$54.70 gap, or 6.5%. At 936's mix (4.8%), 1178's CPA would rise to \$71.64, yet 936 is still much cheaper.

The same men 30-34 cost \$6.84 in 916 and \$7.24 in 936 against \$31.15 in 1178, and everyone else is about 7x and 3x cheaper in 916 and 936 than in 1178. Something other than audience mix, such as creative, product or interest targeting, is driving the campaign gap. Campaign 916's men 30-34 rest on 10 ads and 4 approved conversions, so treat that figure as directional.

3.6 Interest categories

The top 10 interests take 65% of spend. Among categories with at least \$1,000 of spend:

- **Best CPA:** interest 29 (\$40.69, 8.6% of spend), interest 20 (\$43.57) and interest 15 (\$45.57).
- **Largest budget:** interest 16 (13.8% of spend) performs close to average at \$60.34.
- **Worst CPA:** interest 27 (\$97.66) and interest 22 (\$86.65). Interest 27 holds 8.8% of spend.

3.7 Wasted spend

423 of 936 ads (45%) recorded no approved conversion, accounting for **\$14,754 or 25.1% of total spend**. Some of these are young or low-volume ads that never had a fair chance, so this is a review list, not an automatic cut list.

4. Recommendations

1. **Shift budget toward men and women aged 30-34.** Reduce spend on women 45-49 first, since it has the lowest efficiency index (0.47). Illustratively, moving half of that budget (\$6,717) equally to men and women 30-34 would add roughly 76 to 141 approved conversions and cut overall CPA by 7% to 12%. Real CPA will rise as spend scales, so

move in steps and monitor. Men are under-invested in all three campaigns, and men 30-34 take 13% of 1178's spend but 28% of its approved conversions, so they are the first audience to scale.

2. **Test 1178 against the cheaper campaigns.** Run a controlled test that gives campaign 936 a meaningfully larger budget and compare CPA. Moving 5% of 1178's spend (\$2,783) to 936 would cut overall CPA by 3% to 6.5% if 936's results hold.
3. **Fix the post-click experience for women.** They click cheaply, so the problem is after the click: product fit, landing page or sales follow-up. Test a women-focused offer and creative. Lifting women's approval rate to the men's level (35.9%) would add about 91 approved conversions and cut overall CPA by 8.3%.
4. **Fix the approval step.** Two thirds of conversions are not approved. Raising the approval rate from 33% to 40% at today's volume would add about 218 approved conversions (1,221 vs 1,003) at no extra media cost and cut CPA by 17.8% (\$58.53 to \$48.09); a lift to 36% cuts it by 8.7%, so investigate why conversions are rejected, and whether it differs by segment.
5. **Audit the 423 zero-approval ads.** Pause those with meaningful spend and no result; keep those with too little data to judge. Redeploying half of that spend at the blended CPA would cut overall CPA by 8% to 11%.
6. **Shift interest budget** from 27 and 22 toward 29, 20 and 15, and re-test. Moving half of the spend on 27 and 22 would cut overall CPA by 2% to 4%.

4.1 Estimated impact of the recommendations

Together, recommendations 1 and 4 could lower overall CPA by roughly 15% to 20%. Each estimate below keeps total spend at \$58,705 and is shown as a range.

Recommendation	What is assumed	Extra approved conversions	Overall CPA change
1. Move half of the women 45-49 budget (\$6,717) to men and women 30-34	New dollars cost 1x to 1.5x the receiving segment's CPA	+76 to +141	-7.0% to -12.3%
1. Larger shift: half of the budget of women 45-49, women 40-44 and men 45-49 (\$14,074)	Same	+128 to +265	-11.3% to -20.9%
2. Move 5% of campaign 1178's budget (\$2,783) to campaign 936	New dollars cost 1x to 1.5x 936's CPA	+32 to +70	-3.1% to -6.5%

Recommendation	What is assumed	Extra approved conversions	Overall CPA change
3. Women's approval rate rises to men's level (30.0% to 35.9%)	Total conversions unchanged	+91	-8.3%
4. Approval rate rises from 32.9% to 36% (or 40%)	Total conversions unchanged	+96 (or +218)	-8.7% (or -17.8%)
5. Redeploy half of the zero-approved spend (\$7,377) at the blended CPA	New dollars cost 1x to 1.5x the blended CPA	+84 to +126	-7.7% to -11.2%
6. Move half of the spend on interests 27 and 22 (\$3,108) to interests 29, 20 and 15	New dollars cost 1x to 1.5x their blended CPA	+16 to +41	-1.6% to -3.9%
Combined: first row of recommendation 1 plus approval rate at 36%	Both effects apply	+179 to +250	-15.1% to -20.0%

The low end of each range assumes new dollars cost 1.5x the current CPA of the receiving segment; the high end assumes the same CPA. The scenarios overlap, so do not add the rows together; the combined row is calculated on its own. These are scenario estimates from observational data, not forecasts, and recommendations 3 and 4 assume a successful operational fix whose cost is not included. Confirm with a controlled test before scaling. Formulas and editable assumptions are in the workbook's Scenario Estimates sheet.

5. Scope and notes on MA.xlsx

This report uses the 936 ads with at least one click, which matches your MA.xlsx totals exactly. The 207 ads left out have 0 clicks and \$0 spend, so they do not affect any cost metric. Spend in this data follows clicks (cost per click stays between \$0.18 and \$2.21 per ad), which is consistent with pay-per-click billing, so ads that were shown but never clicked cost nothing. They carry 488,881 impressions and 212 total and 76 approved conversions with no click attributed, and these are excluded here. Campaign 936 is the most sensitive to this choice, since 176 of its 464 ads are zero-click. The workbook's Reconciliation sheet shows the raw CSV against this scope.

Several statements in the MA.xlsx notes do not match the data:

- "More than 90 percent of the customers came from campaign 1178." The figure is **86.6%** of approved conversions.

- *"99 spent share is in campaign 1178."* The figure is **94.8%** of spend.
- *"It costs us half what we are costing others."* Men cost 39% less per approved conversion (\$45.15 vs \$73.88), a large gain but not half.

The notes' main directions are confirmed: young audiences convert most, older audiences click most and convert least, and men are cheaper to acquire. The note that men have 10 more ads than women is also correct (473 vs 463).

6. Limitations

- The data has no dates, so trends, seasonality and ad fatigue cannot be assessed.
- There is no revenue or margin, so results are cost-per-conversion, not ROI. A cheap conversion is only good if its value holds up.
- Segment CPAs on small budgets (campaigns 916 and 936, small interest categories) are unstable.
- Findings describe association. Targeting was not randomised, so differences between audiences may partly reflect creative, product or budget decisions.
- Interpreting "Total Conversion" as leads and "Approved Conversion" as purchases follows the standard reading of this dataset. Please confirm with the data owner.
